Professor Stringfellow

I think the project is supposed to:

- Be detailed about the students record

- Easy to read and understand

- Be able to send requests from the advisor to the administrators

- Walk the advisor through any issues the student might be having.

- Store student records securely

- Protect information

- Authenticate users

- Track a students degree

- Validate data

Questions for leader to ask customer:

- What security will be used for student records

- What records are needed to be stored

- What do you want the front end to look like

- How will transfers be handled

- What is an advisors access

- What does the admin handle
